Master’s and Finance Manager

Posted on July 31, 2022

What Are Your Short- and Long-Term Professional Goals?

My long-term goal is to become a finance manager who can move comfortably between analysis and decision-making. I do not want to be the person who produces a technically correct model and then leaves somebody else to explain what it means. I want to understand the numbers, test the assumptions behind them, communicate the risks clearly, and help an organization decide what to do next.

Finance first attracted me because it gives structure to uncertainty. Markets move for reasons that are partly measurable and partly human. A company’s value may depend on cash flow, capital structure, competition, regulation, and expectations that change quickly. During my undergraduate studies, I enjoyed learning how financial theories try to organize these forces. I also learned that applying them is more demanding than memorizing a formula.

My internships as a financial research assistant made this difference clear. A classroom problem usually provides the relevant information. In a professional setting, the analyst has to decide which information is relevant, whether the data are reliable, and how much confidence to place in the result. I saw how two people could examine the same company and reach different conclusions because they used different assumptions about growth, risk, or market conditions. Those experiences made me more interested in financial analysis, not less, because I began to understand where judgment enters the process.

In the short term, I want to deepen my knowledge of valuation, financial markets, portfolio analysis, risk, and quantitative methods through the University of San Francisco’s Master of Science in Financial Analysis program. I also want to improve my ability to use data and present conclusions to people who do not share the same technical background. A finance professional may work with accountants, engineers, executives, customers, or regulators. If the analysis cannot be communicated clearly, its practical value is limited.

After completing the degree, my immediate professional goal is to work in a financial analyst or research-oriented role where I can take responsibility for real decisions and continue learning from experienced colleagues. I am particularly interested in roles involving company analysis, investment research, planning, or risk assessment. I do not expect to begin as a manager simply because I have earned a graduate degree. I expect to build credibility by producing careful work, asking useful questions, and accepting responsibility for errors (U.S. Bureau of Labor Statistics, n.d.).

Over time, I hope to progress into financial management. For me, that role means more than supervising reports. A finance manager helps connect strategy with resources. The manager has to understand whether a proposed investment supports the organization's goals, how much risk it creates, what alternatives exist, and how results will be measured. The role also requires leadership. People should be able to raise a concern without fearing that an unwelcome number will be hidden or punished (Bright & Cortes, 2019).

I would like eventually to lead a team in which analytical rigor and ethical judgment are treated as part of the same standard. Financial pressure can encourage people to present the most convenient interpretation of the data. I want to become the kind of manager who can defend an honest analysis even when it complicates a decision.

Why Do You Want to Complete This Degree, and How Will It Help You Achieve Your Goals?

I am applying for a master's degree because my undergraduate education and internships gave me a strong beginning but also showed me the limits of my current preparation. I can understand core financial concepts, yet I want more rigorous training in the way those concepts are used under uncertainty. I need to become faster and more disciplined in moving from data to evidence, from evidence to interpretation, and from interpretation to a recommendation.

The degree will help me strengthen three areas. The first is quantitative analysis. Financial work increasingly depends on the ability to organize large amounts of information, evaluate models, and recognize when a result is sensitive to one assumption. I want to improve my use of statistical and analytical tools without treating software output as truth. A model should support judgment, not replace it.

The second area is market understanding. An individual security or business decision is connected to wider forces such as interest rates, inflation, currency movements, policy, industry structure, and investor behavior. I want to develop a broader understanding of the microeconomic, macroeconomic, and international trends that influence financial assets. This is one of the reasons USF's MSFA program appeals to me. The program's emphasis on financial analysis and economic theory fits the gap I identified during my professional experience.

The third area is communication and leadership. During internships, I noticed that finance teams often know more than they successfully explain. A long report may contain the correct answer but fail to guide the reader. I want to practice writing concise recommendations, defending assumptions in discussion, and presenting uncertainty without becoming vague. Group projects and class discussions can also help me become a better listener. Management requires the ability to understand why another person disagrees before deciding how to respond.

A graduate program also gives me the opportunity to learn in a disciplined sequence. Independent reading is valuable, and I intend to continue it throughout my career. However, a structured degree creates deadlines, feedback, comparison with peers, and access to faculty who can challenge weak reasoning. I need that challenge. It is easy to become comfortable with the methods one already knows.

The STEM designation of the MSFA program is relevant because it reflects the program's quantitative orientation. I am interested in data-driven finance, but I do not view STEM training only as a credential. Its value lies in learning how to use technical tools responsibly. In finance, precision can create false confidence. A number shown to several decimal places may still rest on uncertain assumptions. I want training that helps me understand both the power and the limits of analysis.

The degree will also support my transition from supporting research to owning a larger part of the decision process. At present, my experience has taught me how to gather information, compare trends, and contribute to analysis. The next stage is learning how to design the analysis, defend the methodology, and connect the result with organizational action. That progression is necessary if I am to become a finance manager rather than remain only a technical contributor.

I expect the program to be demanding. That is part of its appeal. I want to work in an industry where decisions affect jobs, investments, and long-term plans. It would be irresponsible to seek that responsibility without preparing myself seriously.

Why the University of San Francisco?

The University of San Francisco stands out because its Master of Science in Financial Analysis combines specialist finance training with the broader values of a university that emphasizes responsibility and engagement. I am looking for a program that treats finance as a field connected to the economy and society, not as an isolated competition to produce the highest return.

USF's location is also meaningful. San Francisco and the wider Bay Area bring together finance, technology, entrepreneurship, sustainability, and data-intensive business. Studying in this environment would expose me to organizations and professionals dealing with rapid innovation and unusual risk. I am interested in how financial managers evaluate businesses whose value depends on intangible assets, changing technologies, and uncertain future markets. The city provides a relevant setting for those questions.

The MSFA program's focus on the trends that influence the value of financial assets matches my academic interests. I want to understand markets at more than one level: the financial statements of a company, the competitive position of its industry, and the economic forces affecting investors. USF's emphasis on rigorous quantitative financial analysis can help me connect those levels.

I am also attracted to the diversity of the university community. Finance decisions are made across

borders and affect people with different priorities. Learning beside students with varied professional and cultural backgrounds would make my own assumptions more visible. I do not want to finish graduate school having learned only how people similar to me interpret a problem.

Another reason is the program's connection with professional development. I value alumni networks and industry contact, but I do not see networking as collecting names. I want to learn how professionals built their careers, which mistakes changed their approach, and what skills proved useful after graduation. A strong network is most valuable when it becomes a community of honest advice and mutual responsibility.

I would contribute my own experience as a research assistant and my willingness to work through difficult analytical questions. I have learned to be patient with incomplete data and to ask what a number actually represents. I would also bring a clear sense of purpose. My goal is not to use the degree as a decorative line on my résumé. I want to leave the program able to perform better work and make more responsible decisions.

The University of San Francisco is the right environment for that development because it offers the technical depth I need while placing education in a larger ethical context. Finance managers influence which projects receive resources, which risks are accepted, and how honestly performance is reported. I want my graduate education to prepare me for that responsibility as carefully as it prepares me for analysis.
